

BECM 3115

CLIMATE AND ARCHITECTURAL DESIGN

QUESTION BANK ANALYSIS

Topic-wise Set Distribution System

Analysis scope	Regular final papers: 2016, 2017, 2018, 2020, 2021, 2022, 2023, 2024
Structure	8 preparation sets - 4 per current section
Priority rule	Most repeated / most recent patterns first
Exam target	Answer 3 sets from each section out of 4

MADE BY 2223033

Prepared from uploaded class notes, lecture slides, student analysis, regular question papers and reference books

How to Use This Analysis

The 3-out-of-4 Reality

The safest strategy is not to memorize isolated questions. Each main question often mixes 2-4 subtopics. The eight sets below are preparation clusters built from repeated question families, so mastering one set gives coverage across multiple historical question numbers.

FASTEST EXAM STRATEGY

Preparation order	Set
Section A - Priority 1	A1 Thermal Comfort & Heat Exchange
Section A - Priority 2	A2 Ventilation & Repeating Numericals
Section A - Priority 3	A3 Microclimate / Envelope / Shading
Section A - Backup	A4 Climate-Context + Climate-Friendly Construction
Section B - Priority 1	B1 Global Climatic Factors & Wind System
Section B - Priority 2	B3 Regional / Site / Urban Climate
Section B - Priority 3	B2 Tropical Climate
Section B - Backup	B4 Elements / Measurement / Basic Thermal Response

Important Warning

Do not completely skip the 4th set. From 2021 onward, main questions are highly mixed. If time is short, prepare the first 3 sets deeply and keep a one-page emergency revision sheet for Set 4.

DATA SCOPE AND METHOD

- Eight regular final-term papers are present in the supplied question bank: 2016, 2017, 2018, 2020, 2021, 2022, 2023 and 2024. A 2019 paper is not present in the uploaded bank.
- The 2020 paper is a reduced 120-mark paper with only three main questions per section. It is counted for topic presence, but not treated as a normal four-question structure.
- Frequency means a direct question or a close conceptual variant appeared in that paper. It is not a claim that the wording was identical.
- Historical papers sometimes place the two teachers' content under different printed section labels. Therefore this analysis maps questions to the CURRENT uploaded Section A / Section B lecture blocks by topic, not blindly by the old printed section heading.
- Overlapping topics (especially site climate and thermal comfort) are assigned according to the dominant lecture framing and question style.

Master Set Distribution - 8 Sets

Frequency across the 8 analyzed regular final papers

Set	Topic Cluster	Freq	2016	2017	2018	2020	2021	2022	2023	2024
A1	Thermal Comfort, Heat Exchange & Comfort Indices	8/8	Y	Y	Y	Y	Y	Y	Y	Y
A2	Non-Thermal Microclimate, Ventilation & Repeating Numericals	6/8	-	-	Y	Y	Y	Y	Y	Y
A3	Designing Microclimate, Building Envelope & Shading	7/8	Y	-	Y	Y	Y	Y	Y	Y
A4	Climate, Context & Built Environment + Climate-Friendly Construction	8/8	Y	Y	Y	Y	Y	Y	Y	Y
B1	Global Climatic Factors, Earth-Sun Relation & World Wind System	8/8	Y	Y	Y	Y	Y	Y	Y	Y
B2	Classification of Tropical Climate & Climate-Responsive Design	7/8	Y	Y	Y	-	Y	Y	Y	Y
B3	Regional, Site & Urban Climate	8/8	Y	Y	Y	Y	Y	Y	Y	Y
B4	Elements of Climate, Climatic Data & Basic Human Thermal Response	8/8	Y	Y	Y	Y	Y	Y	Y	Y

HIGH-VALUE PATTERN ALERTS

- **SITE CLIMATE:** a direct site/regional/microclimate factor question appears in all 8 papers.
- **GLOBAL CLIMATE:** earth-sun / radiation / heat balance / wind-system questions collectively appear in all 8 papers.
- **THERMAL COMFORT:** heat exchange, heat loss, comfort indices or thermal regulation appears in all 8 papers.
- **2021-2024 NUMERICAL TRIO:** air-space/air-change, fire-shelter safety and laboratory ventilation repeat in four consecutive papers.
- **2021-2024 DRIVING RAIN:** DRI or driving-rain exposure appears in four consecutive papers.
- **2023-2024 SOLAR SHADING NUMERICAL:** effective horizontal/vertical projection and incidence-angle problems appear in two consecutive papers.

A1 | Thermal Comfort, Heat Exchange & Comfort Indices

S - MUST PREPARE | Coverage: 8/8 papers

Why this set matters

The most stable Section A family. Thermal comfort, body heat exchange, heat loss, comfort scales or regulation appears in every analyzed paper as a direct question or a close variant.

CORE TOPICS

- Factors of climatic comfort
- Human body heat production and heat exchange
- Heat loss/gain in climatic situations
- Thermal balance equation
- ET, CET, EW and OT
- Vasomotor adjustment
- Subjective variables
- Designer responsibilities for thermal comfort

YEAR COVERAGE

2016	2017	2018	2020	2021	2022	2023	2024
YES	YES	YES	YES	YES	YES	YES	YES

REPEATED QUESTION FAMILIES - PRIORITIZED

P	Normalized repeated question	Years seen	Typical marks
sS	Discuss the process of heat loss/gain in various climatic situations.	2018, 2020, 2021, 2022, 2023	12-20
sS	Explain human-body heat exchange with the environment through conduction, convection, radiation and evaporation.	2016, 2018, 2020	15-20
sS	Explain factors/ideas of climatic or thermal comfort and the designer's responsibility in ensuring comfort.	2016, 2018, 2020, 2021, 2022, 2024	10-20
sS	Explain the progressive development of comfort scales: ET, CET, EW and OT; show how climatic factors are integrated.	2016, 2017, 2021, 2022, 2023	10-15
AA	Write/derive the thermal balance equation of the human body and explain the regulatory response when it is unbalanced.	2016, 2023	5-12
AA	Explain vasomotor adjustment and the role of the autonomic nervous system under different ambient temperatures.	2023, 2024	8-10
AA	Outline subjective variables that influence thermal preference.	2018, 2023, 2024	5-8
AA	Differentiate passive and active thermal control and relate them to indoor comfort.	2018, 2020	10-15

A2 | Non-Thermal Microclimate, Ventilation & Repeating Numericals

S - MODERN-PAPER HOT ZONE | Coverage: 6/8 papers

Why this set matters

The strongest recent trend. From 2021-2024, air-space/air-change, fire-shelter and laboratory ventilation numericals recur with very similar tables and logic.

CORE TOPICS

- Ventilation objectives
- Air change rate
- Air space per person
- Infiltration rate
- Fresh-air requirement
- Heat loss due to air change
- Fire-shelter capacity
- Laboratory suitability
- AH-SH-RH relation

YEAR COVERAGE

2016	2017	2018	2020	2021	2022	2023	2024
-	-	YES	YES	YES	YES	YES	YES

REPEATED QUESTION FAMILIES - PRIORITIZED

P	Normalized repeated question	Years seen	Typical marks
SS	Air-space/infiltration + heat loss due to air change: calculate heat loss for a room from volume, indoor-outdoor temperature difference and ACH.	2021, 2022, 2023, 2024	8-10
SS	Fire-shelter safety: check air-space/fresh-air adequacy for an increased occupant load and suggest how to make the shelter safer.	2021, 2022, 2023, 2024	8-10
SS	Laboratory ventilation: determine whether a lab is suitable for 20 users under normal operation and during power failure.	2021, 2022, 2023, 2024	5
AA	Define air change and state the ways in which ventilation rate is expressed in a built space.	2021, 2022	5-8
AA	Define AH and saturation humidity and calculate RH using the relationship among RH, AH and SH.	2020, 2021	5-12
AA	Explain natural/cross ventilation and how opening arrangement controls air movement.	2018, 2023	8-20

A3 | Designing Microclimate, Building Envelope & Shading

S - HIGH RETURN | Coverage: 7/8 papers

Why this set matters

Microclimate design and solar control repeatedly appear as sketch-heavy design questions. Recent papers increasingly combine theory with a shading calculation.

CORE TOPICS

- Layout and spacing
- Opening position
- Air movement
- Building envelope
- Roof/wall/window response
- Microclimatic solutions
- Horizontal/vertical/combined shading
- Seasonal sun control
- Solar shading geometry

YEAR COVERAGE

2016	2017	2018	2020	2021	2022	2023	2024
YES	-	YES	YES	YES	YES	YES	YES

REPEATED QUESTION FAMILIES - PRIORITIZED

P	Normalized repeated question	Years seen	Typical marks
SS	Explain how climatic factors affect building-envelope components while designing a microclimate; use necessary sketches.	2018, 2021, 2022, 2023, 2024	10-22
SS	Discuss microclimatic solutions for hot-dry and warm-humid climates in terms of spacing/layout.	2021, 2022, 2023	10
SS	Specify/explain types of shading devices or effective shading with sketches.	2016, 2021, 2022, 2023, 2024	5-15
AA	Show how an extended overhang/lofty porch blocks summer glare but admits winter sun; sketch seasonal sun positions.	2023, 2024	5-6
AA	Solve a solar-shading problem for a given location, date, time, orientation and window size; determine projection and incidence angle.	2023, 2024	15-17
AA	Discuss layout, spacing and opening position for ensuring air movement and ventilation.	2018	20
BB	Mention/design tools for moderating microclimate.	2018	5

A4 | Climate, Context & Built Environment + Climate-Friendly Construction

A - BROAD BACKUP SET | Coverage: 8/8 papers

Why this set matters

This set combines foundational architecture-climate concepts with sustainable construction examples. Exact wording varies, but the family remains a regular source of shorter theory and application questions.

CORE TOPICS

- Climate-context-comfort
- Climate vs environment
- Man-made environment
- Khana and Vitruvius
- Mitigation and climate-responsive design
- Tube house
- Rat-trap bond
- Organic architecture
- Green/sustainable building
- Traditional vs contemporary materials

YEAR COVERAGE

2016	2017	2018	2020	2021	2022	2023	2024
YES	YES	YES	YES	YES	YES	YES	YES

REPEATED QUESTION FAMILIES - PRIORITIZED

P	Normalized repeated question	Years seen	Typical marks
SS	Differentiate/explain climate, context and comfort in architectural design and show how they influence decisions.	2016, 2017, 2018, 2024	10-15
AA	Discuss Khana's maxim for climate-responsive residential zoning/layout; justify south/east/north/west orientation logic.	2017, 2018, 2024	10-15
AA	Write/explain Vitruvius' suggestions on climate and architecture.	2017	10
SS	Explain tube-house concept/working mechanism and its climatic value.	2016, 2021, 2022, 2024	6-8
SS	Explain/illustrate rat-trap bond construction and its thermal or sustainability advantages.	2020, 2021, 2022, 2023	8-25
AA	Explain green/sustainable building, organic architecture, or climate-friendly movements.	2016, 2017, 2018, 2023, 2024	5-15
BB	Compare contemporary and traditional building materials from the climatic point of view.	2017, 2020	15-25
BB	Explain the "accept the fate / reject development / mitigate" position for climate and built environment.	2018	15

B1 | Global Climatic Factors, Earth-Sun Relation & World Wind System

S - MUST PREPARE | Coverage: 8/8 papers

Why this set matters

A global-climate mechanism appears in every analyzed paper. It is the most dependable Section B source of long theory questions with diagrams.

CORE TOPICS

- Solar radiation quality/quantity
- Earth-sun relation
- Tilt of earth axis
- Radiation at earth surface
- Earth thermal balance
- Thermal force
- Coriolis force
- ITCZ/doldrums
- Trade winds
- Mid-latitude westerlies
- Polar winds
- Annual wind shift
- Topography

YEAR COVERAGE

2016	2017	2018	2020	2021	2022	2023	2024
YES	YES	YES	YES	YES	YES	YES	YES

REPEATED QUESTION FAMILIES - PRIORITIZED

P	Normalized repeated question	Years seen	Typical marks
SS	Explain global wind patterns at different latitudes in both hemispheres with sketches.	2016, 2021, 2024	15-20
SS	Explain ITCZ/doldrums and annual/seasonal wind shifts.	2016, 2021, 2023, 2024	10-15
SS	Evaluate radiation at the earth's surface / explain earth's thermal balance.	2016, 2018, 2020, 2021, 2023, 2024	9-15
SS	Explain how earth's axial tilt and earth-sun relationship control solar distribution and seasonal change.	2017, 2022, 2024	8-20
AA	Explain thermal force and Coriolis force; relate them to trade winds.	2022	10
AA	Define/describe mid-latitude westerlies and polar winds.	2022	13
AA	Assess the influence of topography on global/regional climate variation.	2021, 2023	5-10

B2 | Classification of Tropical Climate & Climate-Responsive Design

S - HIGH RETURN | Coverage: 7/8 papers

Why this set matters

Tropical classification and the contrast between warm-humid, hot-dry and monsoon/composite climates is one of the most repeated long-answer families.

CORE TOPICS

- Climatic zones
- Atkinson classification
- Warm-humid equatorial climate
- Hot-dry desert/semi-desert
- Composite/monsoon
- Tropical upland
- Passive control
- Design precautions
- Ecological considerations

YEAR COVERAGE

2016	2017	2018	2020	2021	2022	2023	2024
YES	YES	YES	-	YES	YES	YES	YES

REPEATED QUESTION FAMILIES - PRIORITIZED

P	Normalized repeated question	Years seen	Typical marks
SS	Classify tropical climates / explain how climatic zones are formed.	2021, 2023	10
SS	Compare or describe warm-humid and hot-dry climates with examples and design implications.	2016, 2018, 2021, 2023, 2024	10-20
SS	Explain the characteristics and building precautions for hot-dry desert climate.	2021, 2023, 2024	10-15
AA	Describe composite/monsoon climate with example and design response.	2017, 2021, 2022	10-20
AA	Justify why passive control is especially important in tropical climate.	2017, 2022, 2023	5-15
AA	Explain ecological considerations that a built-environment designer should take in tropical climate.	2016, 2022	10-15

B3 | Regional, Site & Urban Climate

S - MOST CONSISTENT SITE SET | Coverage: 8/8 papers

Why this set matters

Site/regional/local climate appears in all eight provided papers. Questions move between definitions, factor lists, site-design process and urban-climate deviation.

CORE TOPICS

- Regional vs site climate
- Primary/secondary/tertiary/local factors
- Microclimate deviation
- Site climate data
- Large-site design process
- Urban climate
- Temperature inversion
- Human intervention

YEAR COVERAGE

2016	2017	2018	2020	2021	2022	2023	2024
YES	YES	YES	YES	YES	YES	YES	YES

REPEATED QUESTION FAMILIES - PRIORITIZED

P	Normalized repeated question	Years seen	Typical marks
SS	Identify/explain factors responsible for developing a site or microclimate; distinguish them from regional/macro climate.	2016, 2017, 2018, 2020, 2021, 2022, 2023, 2024	9-25
SS	Describe the fundamental process of designing a site/residential building using site-climate knowledge.	2020, 2022, 2023	10
SS	Analyze causes/effects of deviation of urban climate or explain how human intervention modifies urban climate.	2022, 2023, 2024	8-15
AA	Differentiate site climate, regional climate, macroclimate and urban climate.	2017, 2021, 2022	5-10
AA	Explain temperature inversion from the perspective of global/urban warming.	2021	10
AA	Explain local factors such as soil, topography, wind breakers, water bodies, cities/industries and deserts.	2016, 2017, 2020	10-25

B4 | Elements of Climate, Climatic Data & Basic Human Thermal Response

A - HIGHLY MIXED BUT FREQUENT | Coverage: 8/8 papers

Why this set matters

This set supplies short-to-medium subquestions: measurement, graphs, driving rain, atmospheric pressure, solar data and basic thermal response. Recent papers often place several of these inside one main question.

CORE TOPICS

- Temperature measurement
- Humidity/vapour pressure
- Precipitation/driving rain
- Solar radiation
- Wind measurement/frequency graph
- Sky condition
- Vegetation
- Stevenson screen
- Atmospheric pressure
- Basic thermal comfort/body balance

YEAR COVERAGE

2016	2017	2018	2020	2021	2022	2023	2024
YES	YES	YES	YES	YES	YES	YES	YES

REPEATED QUESTION FAMILIES - PRIORITIZED

P	Normalized repeated question	Years seen	Typical marks
SS	Define driving rain and explain the Driving Rain Index (DRI) for building exposure/design.	2021, 2022, 2023, 2024	5-10
SS	Explain measurement/recording of temperature, humidity and wind; include Stevenson screen or instrument requirements.	2017, 2018, 2021, 2022, 2024	8-20
AA	Draw monthly/annual wind-frequency graphs and explain how they are interpreted.	2017, 2024	13-20
AA	Briefly explain atmospheric pressure / atmospheric depletion.	2022, 2023	5
AA	Discuss solar radiation quantity/radiation at earth surface as climatic data.	2021, 2023, 2024	5-10
AA	Explain thermal comfort, human thermal balance and subjective variables.	2018, 2021, 2023, 2024	5-20
BB	Explain climatic factors affecting building design and how the designer interprets climatic data.	2017, 2024	10-13

Most Repeated Question Families - Overall Ranking

Rank	Question family	Frequency signal	Set
1	Site / regional / microclimate factors and site-climate deviation	8/8	B3
2	Thermal comfort / heat exchange / heat loss / comfort measurement	8/8	A1
3	Global climatic factors: earth-sun, radiation, heat balance, world winds	8/8	B1
4	Climate-friendly construction / sustainable examples (tube house, rat-trap, green)	7-8/8	A4
5	Microclimate design / building envelope / shading	7/8	A3
6	Tropical climate classification and design response	7/8	B2
7	Climatic data, instruments, graphs and measurements	6+/8	B4
8	ET/CET/EW/OT and thermal comfort scales	5+/8	A1
9	Heat loss/gain in various climatic situations	5/8	A1
10	Shading devices / seasonal solar control	5/8	A3
11	Air-space + air-change heat-loss numerical	4 consecutive	A2
12	Fire-shelter ventilation/capacity numerical	4 consecutive	A2
13	Laboratory ventilation suitability numerical	4 consecutive	A2
14	Driving rain / Driving Rain Index	4 consecutive	B4
15	Climate-context-comfort conceptual comparison	4/8	A4
16	Urban climate deviation / human intervention	3-4/8 recent	B3
17	Khana maxim / orientation logic	3/8	A4
18	Vasomotor adjustment	2 recent	A1
19	Solar shading projection numerical	2 consecutive	A3
20	AH-SH-RH numerical	2/8	A2

Question-Type Analysis

1. HIGH-PRIORITY THEORY / DISCUSSION QUESTIONS

- A1: Factors of climatic comfort; thermal comfort ideas; human body heat exchange; heat loss in climatic situations; designer responsibilities; comfort indices.
- A3: Microclimate design; building-envelope response; spacing and openings; effective shading and seasonal solar control.
- A4: Climate-context-comfort; climate vs environment; Khana; Vitruvius; green/sustainable building; tube house; rat-trap bond.
- B1: Earth-sun relationship, axial tilt, radiation, earth thermal balance, global wind pattern, ITCZ, Coriolis force, westerlies/polar winds.
- B2: Tropical climate classification; warm-humid/hot-dry/composite climates; passive control and climatic design response.
- B3: Regional/site/urban climate; factor hierarchy; site-design process; urban climate deviation.
- B4: Climatic elements, measurement methods, driving rain, climatic data interpretation and basic thermal response.

2. PROOF / DERIVATION / ANALYTICAL-EQUATION LIST

Important

The supplied papers contain very few formal mathematical "proofs". What repeatedly appears are equations, relationships, mechanisms and analytical derivations. Prepare the following as derivation-style items.

- Thermal balance equation of the human body and interpretation of imbalance.
- RH-AH-SH relationship: $RH = (AH / SH) \times 100\%$, with numerical use.
- Air change / ventilation expressions and heat loss due to air change.
- Driving Rain Index: rainfall x annual average wind speed; exposure classification.
- Cosine law for incident solar radiation and its building-design applications.
- Solar shading geometry: solar altitude/azimuth, horizontal and vertical shadow angles, effective projection and incidence angle.
- Earth thermal balance / incoming vs outgoing radiation mechanism.
- Heat-transfer logic through conduction, convection, radiation and evaporation.

3. NUMERICAL PROBLEM LIST - PRIORITY ORDER

- S: Air-space / air-change heat-loss numerical (2021-2024).
- S: Fire-shelter capacity and fresh-air safety numerical (2021-2024).
- S: Laboratory ventilation suitability / power-failure numerical (2021-2024).
- S: Solar shading projection + angle of incidence (2023-2024).
- A: Relative humidity from AH and SH (2020-2021).
- A: Ventilation requirement in m³/s, L/s and ACH.
- B: DRI calculation and exposure classification (concept + simple calculation).

Sketch & Diagram Bank

DO NOT ENTER THE EXAM WITHOUT THESE

- Global wind belts + pressure belts + ITCZ.
- Earth-sun relationship and axial tilt / seasonal sun position.
- Earth thermal-balance diagram.
- Human body heat exchange: conduction, convection, radiation, evaporation.
- Heat-loss/gain processes under different climatic situations.
- Hot-dry vs warm-humid building form / spacing sketches.
- Building envelope response: roof, wall, window/opening.
- Horizontal, vertical and combined shading devices.
- Summer vs winter overhang/lofty porch sun control.
- Solar-shading plan for window orientation.
- Cross-ventilation / opening-position sketches.
- Rat-trap bond section/brick arrangement.
- Tube-house section and air-movement principle.
- Stevenson screen.
- Wind-frequency graph / wind rose.

Sketch rule

Use clean labels, arrows and a one-line design implication under each figure. A simple accurate sketch is more valuable than an artistic drawing.

Short Notes & Definition Bank

Section A short-note bank	Section B short-note bank
1. Context	1. Climate vs weather
2. Comfort	2. Solar radiation quantity
3. Man-made environment	3. Atmospheric pressure
4. Climate vs environment	4. Stevenson screen
5. Thermal comfort ideas	5. Driving rain
6. ET	6. DRI
7. CET	7. ITCZ
8. EW	8. Doldrums
9. OT	9. Coriolis force
10. Cosine law	10. Trade winds
11. Atmospheric depletion	11. Mid-latitude westerlies
12. Vasomotor adjustment	12. Polar winds
13. Air space	13. Annual wind shift
14. Air change	14. Site climate
15. Infiltration rate	15. Regional climate
16. Tube house	16. Urban climate
17. Rat-trap bond	17. Temperature inversion
18. Green building	18. Warm-humid climate
19. Sustainable building	19. Hot-dry climate
20. Organic architecture	20. Composite/monsoon climate

COMPARISON QUESTIONS WORTH PREPARING AS TABLES

- Climate vs Context vs Comfort
- Climate vs Environment
- Global vs Regional vs Site climate
- Warm-humid vs Hot-dry climate
- Active vs Passive thermal control
- ET vs CET vs EW vs OT
- Horizontal vs Vertical vs Combined shading
- Traditional vs Contemporary building materials
- Sustainable building vs Green building
- Hot-dry vs Warm-humid microclimatic spacing/design response

3-Out-of-4 Preparation Strategy

If you have enough time

Prepare all four sets in each section. This is the only fully safe approach because recent papers deliberately mix subtopics.

IF TIME IS LIMITED - SECTION A

- 1) MASTER A1 completely: theory + diagrams + ET/CET/EW/OT.
- 2) MASTER A2 numericals: practice at least one air-change, one shelter and one lab problem without notes.
- 3) MASTER A3 design: envelope + microclimate + shading sketches; practice one solar-shading numerical.
- 4) BACKUP A4: memorize climate-context-comfort, Khana, tube house, rat-trap bond and sustainability definitions.

IF TIME IS LIMITED - SECTION B

- 1) MASTER B1 completely: earth-sun, radiation, heat balance and world winds.
- 2) MASTER B3: factor hierarchy + site design + urban climate deviation.
- 3) MASTER B2: tropical classification + warm-humid vs hot-dry + design response.
- 4) BACKUP B4: DRI, Stevenson screen, wind graph, climatic measurement and short thermal notes.

Last-night rule

Do not spend the last night reading entire reference books. Use the set pages in this analysis as the map, then open the matching class slide/note only for diagrams, exact formulas and teacher-specific wording.

RECOMMENDED REVISION CYCLE

- Day 1: A1 + B1 (highest-recurrence theory).
- Day 2: A2 + B3 (numerical + site climate).
- Day 3: A3 + B2 (design/sketch + tropical climate).
- Day 4: A4 + B4 (backup sets + short notes).
- Final revision: numericals, diagrams, comparison tables, then only the S-priority question families.

Source Map & Reliability Notes

PRIMARY FREQUENCY SOURCE

- Climate and Architectural Design QB (16-24).pdf - used to identify year-by-year recurrence, marks and recent trends.

SECTION A MAPPING / CROSS-CHECK

- Qs Analysis- Shahriar Sir.pdf - used as a secondary lecture-wise map, then cross-checked against the original regular papers.
- Section A lecture slides (Lectures 1-11) and Shahriar Sir class notes - used to determine current topic boundaries and terminology.

SECTION B MAPPING / CROSS-CHECK

- Section B lecture slides: Introduction, Global Climatic Factors, Elements of Climate, Tropical Climate, Site Climate and Thermal Comfort.
- Billah Sir / Abu Safayet Sir notes - used to align the current Section B syllabus with past questions.

REFERENCE BOOKS

- Manual of Tropical Housing and Building: Climatic Design - used only as a reference map for standard topic structure and diagrams.
- A Text Book of Climate & Design for the Built-form Designers (Bijon B. Sharma and Falguni Mallick) - used only for topic terminology and deeper reference support.

Reliability note

Question frequency is based on the uploaded regular papers, not on the student analysis. The student analysis was treated as a secondary guide. Where old exam section labels conflict with the current uploaded teacher-section split, topic content controls the mapping.

END OF ANALYSIS

Made by 2223033
